C# - NET Core CLI Lab

Orestis Meikopoulos
Consultant – Modern Apps

Agenda

- We will use dotnet core CLI commands in order to create an entire new solution named **NetCoreCliLab** with the following components:
  - A very simple library called **MyWebApp.DataStore**
  - A unit tests project called **MyWebApp.DataStore.Tests** that will cover our library
  - A simple web api project called **MyWebApp.Client** that will use our library as a client
  - A simple dotnet core console app called **MyConsole** that will also use our library as a client

ASK: Follow the instructions inside **LabInstructions.md**. You can find this file inside **Day 1 -> NetCoreCliLabFinal -> LabInstructions** folder of the **Microsoft.CSharp.Advanced** solution

How it Works

- Run this as a standalone exercise in any folder of your system you like, preferable in the one that you are keeping all your development projects

- At the end of the allotted time, one of you is going to be picked to walk us through the exercise

Exercise

NET Core CLI -> Create a new solution with tests and more (25 mins)

Wheel of fortune

Microsoft

Thank You

- For the opportunity
- For participating
- For listening
